My Experience in Creating a Coding Project

Last week, I tried to create a simple website using HTML and CSS. At first, I prepared my tools such as a text editor and a browser. Then, I started by writing basic HTML structure like `<html>`, `<head>`, and `<body>`.

After that, I added some elements such as headings, paragraphs, and images. I also used CSS to make the website look more attractive by adding colors, margins, and layouts. I felt excited because I could see my project running in the browser.

However, I faced several problems during the process. One of the main issues was that my CSS did not work properly. I realized that I made mistakes in writing class names and forgot to link the CSS file correctly. Another problem was incorrect HTML tags, which caused the layout to look messy.

To solve these problems, I checked my code carefully and searched for solutions on the internet. I also tried to fix small errors step by step. Finally, my website worked well and looked better.

In conclusion, creating a coding project is not always easy, but it is a valuable experience. I learned that patience and careful checking are very important in coding.
